The more details and the authenticity of the report will be confirmed at <http://www.agc-cert.com>.

**TEST LIMITS:**

The H-field limit in dB $\mu$ A/m at 3 m,  $H_{3m}$ , is determined by the following equation:

$$H_{3m} = H_{10m} + C_3 \text{ (F.2)}$$

Where:  $H_{10m}$  is the H-field limit in dB $\mu$ A/m at 10 m distance according to the present document; and  $C_3$  is a conversion factor in dB determined from figure F.2.

The limit at 10 m ( $H_{10m}$ ) is 60 dB $\mu$ A/m.

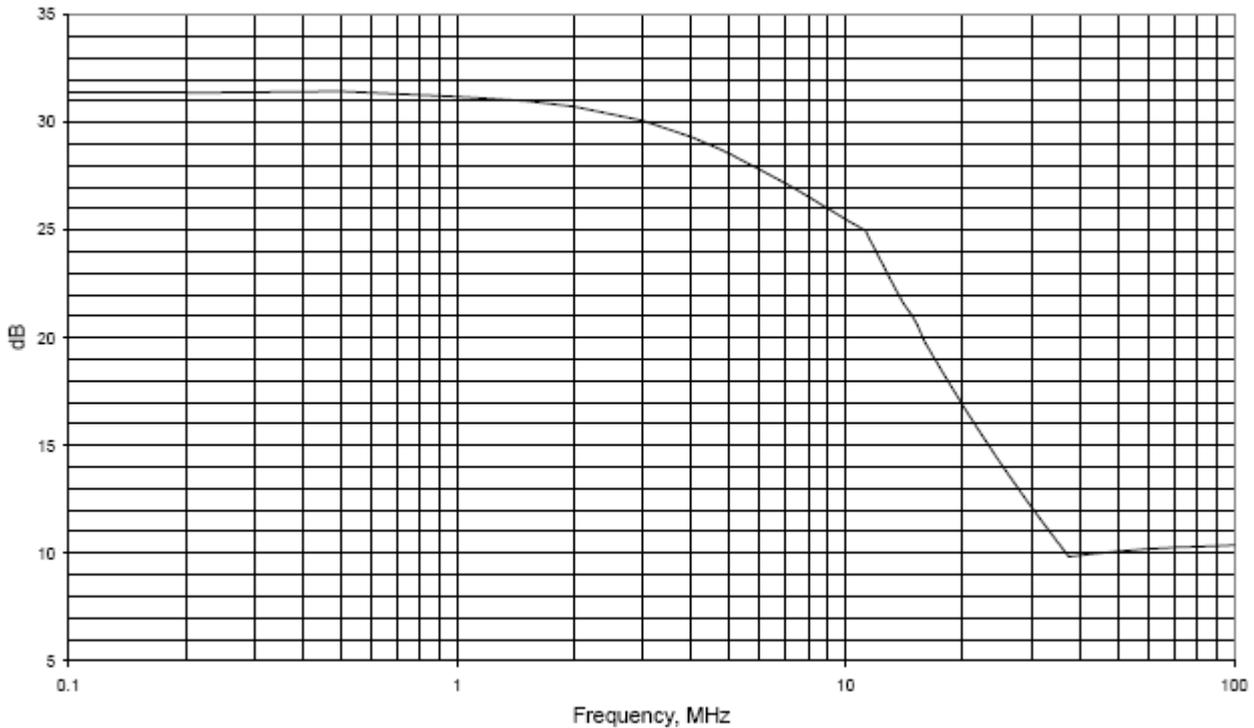

For 13.56MHz:

Owing to the frequency EUT is 13.56MHz, so the  $C_3$  approach to 23dB.

Then the limit at 3m ( $H_{3m}$ ) =  $H_{10m} + C_3 = 60 + 23 = 83$  dB $\mu$ A/m.

The H Field Strength shall not exceed the values 83 dBuA/m 3m Distance under normal test conditions.

Correction factor,  $C_3$ , for limits at 3 m distance, dB

**TEST PROCEDURE:**

The EUT was placed on the top of an insulating table 0.8 meters above the ground at a semi-anechoic chamber. The table was rotated 360 degrees to determine the position of the highest radiation.

The EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.

The H-field is measured with a shielded loop antenna connected to a measurement receiver.

The measuring bandwidth and detector type of the measurement receiver shall be in accordance with EN 300 330 V2.1.1 clause 5.12.

The EUT operate with modulation under normal and extreme conditions.

13.56	11.83	12.35	24.18	60

**Remark:**

- (1) Corrected Level (dBuA/m) = Reading Level + Antenna Factor
- (2) For the calculated method, please refer to Annex F at EN 300330.
- (3) All extreme conditions were considered for test, but only record the worst case.  
 $EIRP(dBm) = E(dBuV/m) + 20 \lg(D) - 104.8$ , D is the measurement distance.
- (4)  $E(dBuV/m) = dBuA/m + 51.5$ , so the  $dBuA/m = EIRP(dBm) + 43.7$ ,  $EIRP = 10 \lg P(mW)$

**SUBSTITUTION METHOD:**

RADIATED BELOW 1GHZ

**TEST PROCEDURE:**

For test method of frequency range (9 kHz-30MHz)

The EUT was placed on the top of an insulating table 0.8 meters above the ground at a semi-anechoic chamber.

The table was rotated 360 degrees to determine the position of the highest radiation.

The EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.

The H-field is measured with a shielded loop antenna connected to a measurement receiver.

The measuring bandwidth and detector type of the measurement receiver shall be in accordance with EN 300 330 V2.1.1 clause 5.12

The EUT operate with modulation under normal and extreme conditions.

For test method of frequency range (30 MHz-1000MHz)

EUT was placed on a 1.5m height wooden table. The search antenna is placed at 3m distances from the EUT and search antenna height is from 1-4m. With the transmitter operating at continuously mode, the turntable was slowly rotated to locate the direction of maximum emission. Once maximum direction is determined, the search antenna was raised and lowered in both vertical and horizontal polarizations.

The EUT was removed from the turntable and replaced with a linearly polarized antenna connected to a calibrated RF signal generator. The RF generator was set to a measured emission frequency and the search antenna was raised and lowered to produce a maximum received reading. The generator output was increased to match the radiated emission reading measured previously, and the result expressed in dB EIRP or ERP, correcting for substitution antenna gain at each frequency.
